

Precision Amino Acid Nutrition Designed for Renal Care

A Targeted Approach to Nutritional Support in Dialysis Patients

Patients undergoing dialysis face a difficult nutritional balance: replacing protein and amino acid losses while limiting phosphorus, potassium, sodium, and fluid intake. Conventional protein supplements may introduce large proteins or peptides along with additional electrolyte and phosphorus burden.

Albugenyx® offers a different approach.

Albugenyx® is a renal-specific amino acid dietary supplement developed to provide targeted protein building blocks that support endogenous albumin biosynthesis while addressing the unique nutritional needs of patients with kidney failure.

WHY ALBUGENYX®?

Targeted Amino Acid Delivery

Provides specific free amino acids selected to support albumin and protein biosynthesis rather than relying on large intact proteins or protein fragments.

Renal-Focused Formulation

Designed specifically for patients with renal failure, with attention to phosphorus and electrolyte content that can complicate conventional nutritional supplementation.

Pre-Digested Protein Building Blocks

Free amino acids provide readily available building blocks without requiring the same degree of digestion associated with intact dietary proteins.

Low Caloric Burden

Designed to deliver targeted amino acid nutrition without the high caloric load associated with many traditional renal nutritional shakes.

Zero Sugar

Formulated without sugar, providing an additional nutritional consideration for patients managing multiple metabolic concerns.

Easy Consumption

The powder formulation may be consumed with food or dissolved in liquid.

WHAT'S IN EACH 20 g SERVING?

18g

Protein Building Blocks

+

2.5g

Arginine

+

Plus Targeted Nutritional Cofactors

Formulation components include selenium, magnesium, vitamin B6, omega-3, and other ingredients selected to support amino acid metabolism and nutritional function.

HOW IS ALBUGENYX® DIFFERENT FROM A STANDARD PROTEIN SUPPLEMENT?

Albugenyx®

- Amino acid formulation
- Targeted protein building blocks
- Designed specifically for renal care
- Formulated to support albumin biosynthesis
- Designed for enhanced amino acid availability

Conventional Protein Supplements

- Commonly contain intact proteins, peptides, or larger protein fragments
- May require greater digestion
- May contain higher amounts of phosphorus, sodium, or potassium
- Typically provide generalized rather than albumin-targeted protein nutrition
